

## Corporate Image Creation

Image creation is the design and implementation of standardized computer configurations. This enables existing and new PC's to have the same software and settings for company uniformity. This will save support costs and guarantee's all employee's have company standard software.

It generally would take a support technician 6 hours to configure a new PC. The technician would need to Install Office, Antivirus software, Financial software, Company proprietary programs, utilities, and 100's of program and Windows settings to conform to company standards. It takes less than 30 minutes to place an Image, Create a unique name and join the computer to your domain.

For each computer you Image instead of loading from scratch you are saving not only 5.5 hours of technician time and money but forcing software uniformity which is equally important. As an example paying your imaging technician \$25 an hour you are saving \$137.50 each PC that is imaged.

### Requirements for an Imaging friendly environment:

Storage which can include USB Hard Drives or Network Storage

Ownership or Purchase of Ghost, ImageX and in some cases UIU

Each environment is unique as are my Imaging solutions. I have been creating standardized images for over 40 models of laptop and desktop computer in the past 8 years. In many cases I can take dozens of Images and create 1-2 master images that will work on multiple hardware platforms. This will save thousands each year in IT costs as updating images can be very time consuming. I can update your images on a monthly basis or will train your staff how to update them and be self sufficient.
